Hello,

I am a Computer Science graduate from University at Buffalo. I graduated this semester and I am looking for jobs in Software Engineer profiles.

Software Development have always been my area of interest. I am confident and proficient in java and Object Oriented Programming skills, as I have done several challenging academic and side projects in Java and Android. Projects for my Distributed Systems class were really interesting and involved socket programming, multithreading and handling concurrency between multiple threads.

Moreover, I have done Data Science related academic projects in python, Hadoop Map – Reduce, R and Tableau.

I have even worked as a software engineering intern at a healthcare company - Mortara Instrument, Milwaukee, WI. Working here, I learned C++ and enhanced my debugging skills.

Java is my comfort zone, but I do not mind stepping out of my comfort zone to learn new and trending things. I believe in being a problem solver and programming languages or tools should not be a barrier for me.

I believe my academic and professional background appeals to your company's work culture.

Thanks

Aniruddh
